4. **Features**

   Intel® Server SNMP (Simple Network Management Protocol) subagents are SNMP extension agents that provide interfaces and databases for retrieving server hardware information and for monitoring server health status on the network using SNMP. The SNMP subagents support SNMP-based access (GETs, SETs and TRAPS) to the instrumented components on the managed server, collecting and returning information as requested by a management system. The subagents plug into the SNMP master agent infrastructure supported by the operating system and respond to queries and sets filtered to the subagents by the master agent, based on the OID specifying the data defined in the MIB to be retrieved or set.
