<td>Issue caused by OS using interlaced modes rather than progressive (e.g. 1080i instead of 1080p). Although this is not an Intel driver functionality, we have implemented a 'work-around' fix of offering the option to removing the interlaced modes from the list of modes shown as supported by the system.</td>

Additional information on the ‘interlaced modes work-around’:

For the purposes of testing the work-around, the switch to turn on and off the interlaced modes is in the graphics driver’s ‘.inf’ file. We have set the switch on this beta driver to ON by default, meaning the interlaced modes will not be available when using this driver. The driver has been WHQL certified with the switch set in the ‘.inf’ file, and should install normally. If you modify the ‘.inf’ file, the WHQL certification will be broken and a warning message will appear when installing the driver – even if you change the setting back.

FAQ:

Q: Will this beta driver remove interlaced modes from all the displays connected to system?
A: Yes.

Q: Is it possible to remove interlaced modes only on a particular display?
A: No. This update will remove interlaced modes on all displays connected.

Q: Can I get back the removed interlaced modes.
A: Although it is technically possible to edit the system registry and change the value, we strongly discourage customers from attempting this, as you can easily damage your driver and operating system installation.
To get back the interlaced modes, please revert back to your previous graphics driver, or download and install the latest production version graphics driver for your system.

Q: Will this beta driver remove all interlaced modes, even if the native resolution of the display is an interlaced mode?
A: No, the native resolution will not be removed (it would be excluded from removal list) – Since this would result in undesired behavior.

Note:
1. If you are uncertain which Intel processor is in your computer, Intel recommends using the Intel Processor Identification Utility or Intel Driver Update Utility to identify your Intel processor.
2. In the Intel® Iris™ and HD Graphics Control Panel (under Options > Options menu > Information Center), the 'Installed DirectX* version' refers to the operating system's DirectX version. The Information Center’s ‘Supported DirectX* Version' refers to the Intel Graphics Driver's supported DirectX version. The DirectX 12 API is supported but some optional features may not be available. Applications using the DirectX 12 API should query for feature support before using specific hardware features. Please note that DirectX12 is only supported on Windows 10 and DirectX11.3 support is also available on supported Microsoft* operating systems.
